

## Read and Interpret Line Graphs

This line graph shows the average amount of electricity being used each hour by a household during term time and in the holidays. Using the graph, investigate what different activities could be taking place at the different times.

Various answers, for example: between 9am and 3pm during term time, the amount being used is low because everyone is out of the house, but isn't zero because things like the fridge will still be plugged in. More electricity is used during the holidays because more people are at home.
